```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Original source text: Minute virus of mice (strain MVM(p)), passed in mouse 1 (variant A-9) cells.

Original source text: Minute virus of mice (strain MVM(p)), passed in mouse 1 (variant A-9) cells.

The parvoviridae family cantains two groups that infect mammalian hosts: (i) defective (helper-dependent) adeno-associated viruses, and (ii) autonomous (helper-independent) parvoviruses. MVM is a member of the latter group. Both groups have been demonstrated to package both plus and minus strands (in separate particles) of the ssnDNA aponome, though the minus strand is more typically packaged in the latter group.

The sequence below corresponds to the plus (+) strand, also referred to as the C-strand. The minus (-) strand is also referred to as the V-strand.

The 3' and 5' termini both exhibit the potential for forming stable for iteration.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treplication [1].

The left and right halves of the genome encode two distinct, but overlapping transcriptional units. The transcripts can be summarized [1] (1 map unit (mu) = 51 bp):

R1 (4.8 kb): 4.5 mu - 46 mu; 46+ mu - 95 mu
R2 (3.3 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu
R3 (3.0 kb): 40 mu - 46 mu; 46+ mu - 95 mu
R3 is the major transcript.

R3 is the wajor open reading frames, both on the plus (or C) There are two major open reading frames, both on the plus (or C) afternd. The left side ORF (261-2279) probably encodes a non-capaid protein of 85 kd; the right side ORF probably encodes the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Three splicing patterns are used to excise the small intron common to all minute virus of mice RNAs J. capsid proteins, VP1 (or A, 83 kd), VP2 (or B, 64 kd), and VP3 (or C, 61 kd). But because of uncertainties about the precise splice points in the transcripts, the exact starts, stops and (possible) intron bundaries are not known.

The present sequence is a DNA encoding parvovirus non-structure protein 1 (NS1) variant (1363A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cyctocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-NUG-2003 to correct OS field.)

The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene
                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                             The present sequence is a parvovirus non-structure protein 1 (NS1) variant ($283A) DNA fragment. The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-NUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and

The present sequence is a DNA encoding parvovirus non-structure protein (NSI) variant (1463A). The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-ANG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

                                 The present sequence is a DNA encoding parvovirus non-structure protein (NS1) variant (T394A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                             This viral DNA is isolated from a non- attenuated CPV. The DNA is preferably derived from vB1440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGEM3Z or pGEMSZ. The host cells to be transfected ar selected from Norden Laboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or canine A72 cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a wild type DNA encoding parvovirus non-
structure protein 1 (NS1). The present invention relates to the variants
of the parvovirus non-structure protein (NS1) having a shifted
equilibrium between the DNA replication and transcription activities, and
the cytotoxicity activity. These variants are useful as toxins for
treating tumoural diseases. The variant DNAs are useful as vectors for
gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              900

                                                 This viral DNA is isolated from an attenuated CPV. The DNA is preferably derived from vB1440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGB312 or pGEM52. The host cells to be transfected ar selected from Norden Laboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= c

They have one or more of the sequence alterations indicated in the sequence relative to the sequence of a control (5th passage) wild-type CPV-2b (see AAT88320). A claimed virus from the 65th passage (deposited as ATCC W 2528) contains all 6 mutations. The DNA from attenuated CPV strains (see also AAT88324) is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The attenuated viruses can be used in dogs as a vaccine to protect against CPV disease, or more generally in cats and minks to protect against feline patheukopenia virus and mink enterties virus. The

This DNA sequence comprises the genome of virulent canine parvovirus type 2b (CPV-2b) isolate 39, obtained after 5 serial passages in NLFK feline kindey host cells. Further passaging has yielded attenuated virus vBI440 (ATCC VR 2489) (see AAT88324) from the 66th passage, and a claimed virus (see AAT88321) derived from the 65th passage, and a claimed virus (see AAT88321) derived from the 65th passage (ATCC 2528). These stages virus. The DNA from attenuated CACC 2528) is used for the passage virus. The DNA from attenuated clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The cattenuated viruses can be used in dogs as a vaccine to protect against cattenuated viruses and mink entertis virus. The vaccines protect against feline panleukopenia virus and mink entertis virus. The vaccines protect against the currently prevalent cattains of types 2 and 2a), and provide a long term immune response. (Updated on 17-007-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This DNA sequence comprises an attenuated virus genome derived by serial passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate 139 in NLEK feline kidney host cells. The attenuated virus is designated value (ATCC VR 2489). It contains 4 mutations relative to the sequence (see AATB8320) of the control (5th passage) wild-type CPV-2b. 2 Mutations are within the hairpin formed by the 3' terminal palindrome: the mutation cross are within the hairpin formed by the 3' terminal palindrome: the mutation cross at nucleotide 59 introduces an A into a G-C rich region within the tip of the hairpin, disrupting the base pairing in one of the 2 small internal control the mismatched bubble (flip-flop) sequence within the control palindrome. The DNA from attenuated CPV strains (see also AAT88321) is used for the production of infectious molecular DNA clones, which, in the palindrome transfected into cells to generate master stocks of the virus. The attenuated viruses can be used in dogs as a vaccine to protect against feline panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant strains of types 2 and 2a), providing a long term immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Canine parvovirus DNA carrying specific attenuating mutation(8) - used as vaccines for protection against parvovirus and feline pan-leukopenia virus infections.

Clostridium acetobutylicum

WO200277183-A2

03-OCT-2002

Gene, liver cancer; ds; hepatocellular carcinoma; hepatotropic; metastatic liver tumour; cytostatic; expression profile; disease st disease progression; drug toxicity; drug efficacy; drug metabolism.

Gene #2617 used to diagnose liver cancer.

```
the invention relates to an isolated mucieic acid comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producting the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confidention or that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation of an organism acts; (9) manufacturing an entibiotic; (10) profiling a compound that inhibits proliferation of the test compound that inhibits proliferation of the strains is present in a culture or collection of the strains is present in a culture or collection of the strains is present in a culture or collection of the strains is present in a culture or collection of solutifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational chief drug discovery programs, or for screening homologous nucleic acids are useful for required for proliferation or or solate candidate molecules for rational crossors are not better acids are useful.
                                                                                                                                                                                                                                                                                                                                                                                              screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at 100.
                                                                                                                                                                                                                                                    Zyskind JW;

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN03503-ABN09455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, array forsity, drug efficacy and drug metabolism. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at

Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a liver tissue sample.

```
A cDNA clone of rapeseed, identified as encoding ACCase, was used to probe a genomic library prepared from A. thaliana. The 5' sequence of an isolated subclone, pKLU81, was determined. (Updated on 25-MAR-2003 to correct PN field.)

```
The sequence represents the 5' end of subclone pKLU81 (NCIB 40555) encoding the Arabidopsis thaliana acetyl Coenzyme A carboxylase (ACCase) cDNA, which can be used to create a sense or an antisense expression cassette to transform rape and other oilseed plants (canola, soybean, sunflower) to downregulate production of the ACCase enzyme. The transgenic plants have a lower or a modified oil content. Down-regulation of il synthesis can be used to divert the substrate, acetyl Coenzyme A, into synthesis of alternative storage materials (starch, protein or novel polymers e.g. polyhydroxyalkanoates). Full-length ACCase clones can be used to create transgenic plants over-expression and therefore with increased oil content. ACCase over-expression in monocot plants such as wheat, barley, maize and rice, which are normally sensitive to herbicides, results in aryloxyphenoxy-propionate and alkylketone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                herbicide resistance in the transgenic plants (dicots are normally resistant to these herbicides).                                                                                                                                                                                                                                                                       Once-Torgan: Periole, Vector: pDNR, Site 1: Sfil; Site 2: Sfil; CAP is a cDNA library of Vitis vinifera cv. Cabernet Sauvignon. Clone 8 petioles. Samples were collected on July 10, 2002 from plants on the onset of Veraison (berry softening). Sampled vines were located the University of California, Davis, Experimental Vineyard. cDNAs were made by oligo-dT priming and directionally cloned. 5' and 3' adaptors were used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CA12EI301IIR G12 Cabernet Sauvignon Leaf - CA12EI Vitis vinifera cDNA clone CA12EI301IIR G12 3', mRNA sequence.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                              Sequence 1, Application US/08336345
Patent No. 5814510
GENERAL INFORMATION:
APPLICANT: Parrish, Colin R.
APPLICANT: Gruenberg, Allen
APPLICANT: Carmichael, Leland B.
TITLE OF INVENTION: Attenuated Canine Parvovirus Vaccine
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 28.6; DB 1; Length 5049;

The present sequence is parvovirus non-structure protein 1 (NS1) variant (S283A). The invention relates to the variants of the parvovirus nonstructure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

The invention relates to the variants of the parvovirus nonstructure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is parvovirus non-structure protein 1 (NS1) variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
